A

Adolescence
  sexual orientation
    yearly change in  214–219
Adrenal syndrome  107
Aggression  68
  counselling effective  22
  drug tests, imitation of genetic effects  22
  links to known gene  22
American Psychiatric Association  225–227
  homosexuality repudiated as disorder  225–227
American Psychological Association  6, 227
  intimidation tactics  228–230
  therapy advised against  227
Anglican Church  7
Anglican Church and SSA
  Episcopalian bishop qualifications  55
Archbishop Tutu, Desmond, SSA attitude  7
Asexuality  88

B

Barnhouse, Tiffany
  condemnation of ignoring valid change evidence  240
  condemnation of SSA fixity ideas for adolescence  219
Bem, Daryl  76
  childhood gender nonconformity a much stronger factor for SSA than
    genetics  203–205
Bisexuality  87
  change
    adolescence, yearly change in  214–219
  biblical example  221
  reasons for seeking  235–239
  spontaneous  218–219
  therapy  221–224, 227–229
  existence of, supported  47
  married, percentage  47
  mostly heterosexual  47, 87
Bowlby, John
  affection development in orphans  65
Brain
- adolescence 153
- complexity of 37
- development of 151–152
- DNA cannot specify complexity of 152
- fantasy, effects on 153–154
- gender, relative lack at birth (rats) 62
- heterosexual/homosexual differences? 148–149
- male/female difference dubious 142–150
- gene studies 147–148
- male-type organisation, no evidence for 106
- maternal influences (rats) 151
- plasticity of 152–157
- post birth factors 149–150
- pregnancy effects on 142–144
- sexual abuse effects 154
- sexuality not hardwired 156
- soul, room for 37
- testosterone surge 149
- transgender 149
Brothers. See Siblings

C

Cell
- biochemical reactions per second (one billion), 19
- interaction with other cell types, biochemically 36

Chang, Jung
- Chinese foot-binding, as cultural erotic example 77

Childhood gender non-conformity
- genetic origin, extent of, 81
- homosexual fantasy correlation 135
- path analysis -diagrams 196–197
- predictor of homosexuality 81, 195
- rebellion against gender norms 82

Children
- shared environment, different reactions, in gender ID development 72

Chromosomes, structure, extreme DNA packing 16

Clergy 7
- AIDS in 55
- homosexuality in 54–55

Craving for Love (book on SSA psychology), 13
Index

D

Delinquency
  linked to maternal separation 64
DNA. See also Genome (all genes in an organism)
  chromosomes, folding into 16
  diagrams 16
  genes absent on 90% of length 17
  infinity in, (symbol), 17
  instability, biochemical 15
  rungs, chemical description 17
  strand a “lifetime” long 15

E

Education
  Schools 9
  Effect strength 11
Epigenetics (environmentally influenced genetics) 24
  fetal development errors 30–32
  histones 25–27
  mice (histones) 26
Ex-gays
  AA parallels 231–233
  denial of free speech to 220
  hostility towards 219–220
  invisibility, reasons for 219–220
  support groups 223, 231–232, 240–242

F

Fetal development error?
  diagram 31–32
Frederick II of Germany
  orphans deprived of social contact, lethality of 63–64

G

Gender 71
  birth
    differences
      five months post birth 67
      minor extent of 65
  competition/cooperation as gender schema 71–72
  first attraction age 72
  fluidity of beliefs about in preschool-age children 68–69
identification with gender of a parent 69
  boys 70–71
  girls 70–71
parental treatment differences 66, 71–72
peer group members develop each other’s gender 71
sex play prevalence 72
siblings, effect on development 71
social treatment of gender depending on false assumptions 66
toy preference 67, 68
  monkey - same as human 67
Gender Dysphoria 9
Gender identity disorder 9, 111, 195
Genes
  behaviour
  chemical analysis of a book for text understanding, analogous 37
dictated by (opinion of sociobiologists) 19
dictated by single gene? 20
epigenetic effects. See Epigenetics (environmentally influenced genetics)
expedient lie? 34
generational change slow 29
links
  difficult to replicate 21–22
  indirect 28
  many genes linked 24, 28–29
  many genes linked; fruitflies 28
  many genes linked; IQ 28
  many genes linked; mice 25–29
  sandhopper links established 24
  mice gene expression much affected by technician handling 26–27
expression 18–19
  in different organs 19
  multiple other gene products required 20
expression/repression of, factors controlling 18
gene linkage studies 162–165, 167
  homosexuality 165–168
  schizophrenia 164–165
  unreliability of 163–164
genetic code 18
genome scanning 165–166
  homosexuality 166–167
  schizophrenia 164–165
homosexuality - see Homosexuality, genes for 20
learning from environment, independence from genes 36
minimum number for viable cell 16
multiple reactions between 20
muscle “springs” 17
number, human 16
size 16
transcending them 37
variability, too few to account for varieties of homosexuality 124
world-wide human similarity 114
Genetic code 18
Genome
  bacteria 16–17
    simple artificial made 16–17
  bacteria (178 species sequenced) 16–17
Genome (all genes in an organism)
  human 17
  Neanderthal 17
GID (Gender identity disorder) 9

H

Hamer, Dean
  birth test for homosexuality impossible 167
  first attraction age, SSA/OSA 32–34
  gene for homosexuality? 20, 162
Height
  genetic proportion 46
    comparison with SSA proportion 46
Heterosexuality
  addiction 78
  adolescence 214, 219
    most will not change 219
    yearly change in? 214–215
  affection, development of 65
    parental contact essential 63–65
  cultural variation 115–116
  development of 60–78
  erotic arousal, age of first 73
  ex-gay, numerical estimates in population 210, 214
falling in love
  cultural conditioning of 74–76
  exotic aspects, need for 76
  kibbutzim (Israel), no intramarriage 76
  non-Western cultures 77
  random factors, importance of 77–78
  specificity 75
first attraction, age 72–73
genetic percentage calculation 33
goats and sheep; species erotic preference fixed by upbringing 63
learnt 79
monkeys
maternal effects on 61
mostly heterosexual 47, 87
random factors in development of 77–78
rats
maternal effects in development of 61–62
zoo animals, disturbance of reproduction through human contacts 62
Histones (proteins controlling gene expression)
gene expression control 16, 25–27
maternal handling effect 26–27
diagram 27
Homophobia
genetic content 187
Homosexuality
adolescence 214, 218
stability
25x less than heterosexuality 218
identity stability low 85
most adolescents change 218
yearly change usual 214–216
adoption a factor in origin 80
affection sought initially rather than sex 84
aggression lack, sexually attractive to women 30
biological families, loose ties to 30
cancer risk in 239
causal factors 181–183, 186, 194, 202
indirect, usual 186–185
individualistic, environment-related 184–186
individualistic, genetic-related 183–184
significance of social, via path analysis 194–203
supplied by SSA respondents (diagram) 182
change, possibility of 207–208, 214, 219, 224, 229, 231, 233–235, 240, 259
adolescence 214–219
anecdotes 208–209
bee, parable of 259
biblical example 221
diagrams (occurrence in population) 213
drug mediated 224–225
ex-gay groups 231
process details 240
reasons for opposition to 233–235
reasons for seeking 235–239
spontaneous 221
therapy 221–224, 228–230
transgender fluidity 208
childhood gender non-conformity a factor in 85, 199, 203
  genetics much less important than 203–204
choice very minor 182
compulsivity in 237–238
culture 116, 121, 123
  SSA absence in some cultures shows genetic influence minor 121–122
  SSA change within one generation shows genetics minor 120
  SSA diverse expression shows genetics minor 116–121, 124
defensive detachment a factor in 85
disappearance through generations if genetic 29–30
divorce a factor in origin 70
epigenetic cause unlikely 23–24
exclusive, in population, percentage 44
diagrams 43–44
father emotional distance a factor in origin 82
fetal development error? 31–32
first attraction age 32–34
gene linkage probably absent 166–167
genes for
  multiple genes for? difficulties 24
  single gene for? difficulties 20
  genetic contribution
    similar to pregnancy of 15y old? 89
genetic fraction 187
calculations 36, 189
  implies change possible in 187
Greek model of 116
immune attack not a factor in 135–137
increase in recent times 47–49
innateness, is a poor example 177
instinctual? 98–99
learning process involved 89
left-handedness comparison 32
married percentage 29
masculinity felt inferior 86
maternal diminished care a factor (Taiwan), 82
maternal immune hypothesis 135–137
maternal stress a weak factor in 134–135
Melanesian model of 117–118
multiple genes for

Homosexuality continued

unlikelihood of 29
parents a minor direct factor 178–179
peer group poor relationships a factor 80–81
percentage in population 45–46, 56–59
census results 45
scatter suggests minimal genetic influence (diagram) 46
prenatal hormones 128, 130
effects 127–132
finger lengths 130–131
promiscuity in 237–238
psychological trait? (diagram) 34
random events, importance of 181
relationship length 236
sex hormones, adult, little effect 132–133
sexual abuse a factor in origin 83–84
sexual difficulty prevalence increased 236
shared (social) factors apparently minor influence 174, 178–179
siblings a factor in origin 80, 86
single gene for
unlikelihood 20
SSA sons of SSA fathers, prevalence 188
suicidality 218, 242
therapy for 221–224, 233
clients atypical 233
unique path to SSA does not exist 86
urbanisation, effect of 52–54
argues for low genetic percentage 54
Denmark an example 54
Western model of 117, 119–120
changes too swift to be genetic 120
historical uniqueness 120
